

**Researcher result**

The recorded qubit constructions  $[[7, 1, 6; 4]]_2$ ,  $[[9, 1, 8; 6]]_2$  and  $[[11, 1, 10; 8]]_2$  were generalized by researchers to the odd-length family  $[[n, 1, n - 1; n - 3]]_2$ .

**Researcher proposal**

Develop further constructions using other shift steps, quasi-cyclic orbits, multiple radical blocks,  $\text{GF}(4)$ -additive constructions, and extension, shortening or puncturing of the known family.

**Task to the model**

Search 329 qubit parameter targets with  $5 \leq n \leq 13$ , including listed gaps and previously unlisted parameter cells. The task now explicitly includes the discovered qubit family.

**Exact feedback**

Use the same parameter and distance checks. The specification also permits constructing the smaller dual space and converting it to stabilizer generators for evaluation.
