

● machine ○ human ■ pipeline write-back *columns: qubits · rows: generators*

○ seed

random stabilizer set, annealed by
single-generator bit flips

● gen. 1-2

generators become cyclic
shifts of one base string:
 $\mathbf{g}, \mathbf{g} \lll 2, \mathbf{g} \lll 4, \dots$

■ write-back

the pipeline writes the finding into the
seed program *and* the task specification
(archived prompts)

● gen. 3

shift step widened to $\{1, 2, 3\}$ and re-
duced mod $2n$, so orbits wrap instead
of overflowing

● gen. 4

no further structural change
